

Langgraph is an amazing library available in langchain. One amazing thing is, here agents can communicate each other. But for stateful management we use Langgraph.

Langgraph-studio is coming with a studio, by which able to create all workflow by drag and drop. interacting with the agent.

But in this tutorial, we will create it manually with Py

Creating Chatbots using Langraph

Langraph

LangGraph is a library for building stateful, multi-actor applications with LLMs, used to create agent and multi-agent workflows. Compared to other LLM frameworks, it offers these core benefits: cycles, controllability, and persistence. LangGraph allows you to define flows that involve cycles, essential for most agentic architectures, differentiating it from DAG-based solutions.

Agenda

- 1) What is Langraph?
- 2) Why Langraph?
- 3) Getting Started With Langraph

with Graph Db you can build amazing RAG applications.

Why Langraph:

It defines, workflows, logics etc for stateful management.

Why LangGraph

Amazing benefits

① Simplifies development : State Management and agent coordination

Define workflows, logics

② Flexibility :

With LangGraph, developers have the flexibility to define their own agent logic and communication protocols. This allows for highly customized applications tailored to specific use cases. Whether you need a chatbot that can handle various types of user requests or a multi-agent system that performs complex tasks, LangGraph provides the tools to build exactly what you need. It's all about giving you the power to create.

③ Scalability :

Large Scale multi Agent Application

Handle high volume of Interaction And Complex workflows.

Enterprise → level Application

④ Fault Tolerance : handle Errors, Fault tolerance

Reliability.

Here we will create chatbot as a graph nodes, here chat bot state changes from start, chatbot and end

Langgraph With Agents And Tools

Langgraph With Astra DB

Architecture of the project [Multi AI Agents] → State, Communication ⇒ Workflow
