

We build an MCP client inside an MCP host. MCP host will communicate with MCP servers with the help of MCP Client. The protocol that is used to communicate here is MCP protocol.

Initially, the MCP client will make a call to MCP servers and get all the tools/services that are available. Once the response comes to the MCP host, then the question of the input we asked and all the necessary tools will be passed to the LLM. Then the LLM will provide the response with which tool to specifically use. Once that is decided, then the MCP client will hit that MCP server and get the information. This response/information will be provided as a context to the LLM. When you give the right type of context, then the LLM will summarize and provide a better output.

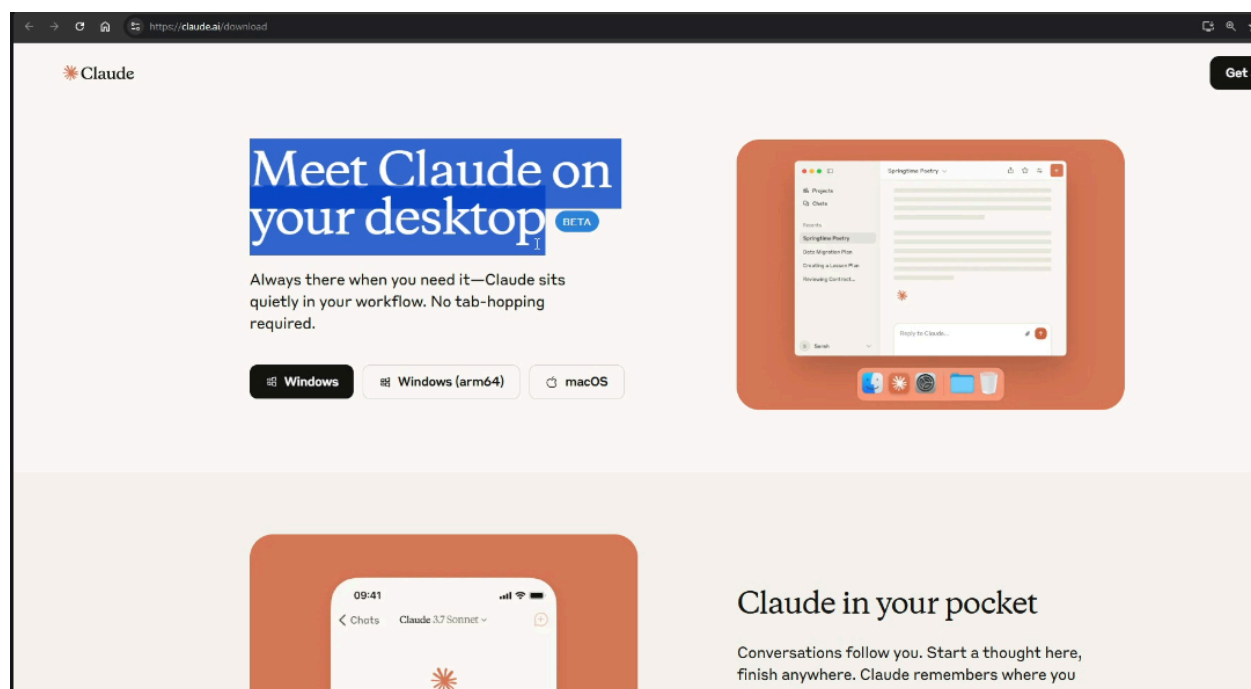

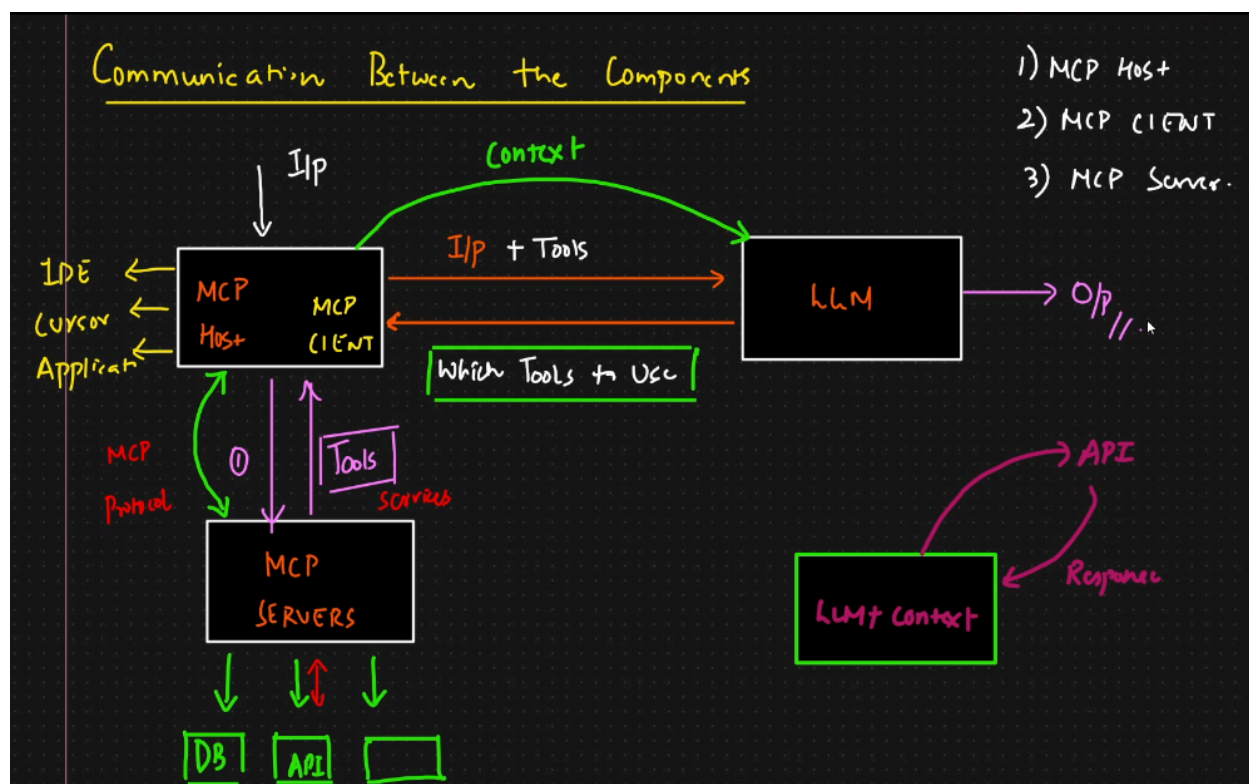

This concept is brought by Anthropic.

General architecture

At its core, MCP follows a client-server architecture where a host application can connect to multiple servers:

- **MCP Hosts:** Programs like Claude Desktop, IDEs, or AI tools that want to access data through MCP

install [node.js](https://nodejs.org/)

Before starting make sure [Node.js](#) is installed on your desktop for `npx` to work.

1. Go to: Settings > Developer > Edit Config
2. Add the following to your `claude_desktop_config.json`:

```
{
  "mcpServers": {
    "airbnb": {
      "command": "npx",
      "args": [
        "-y",
        "@openbnb/mcp-server-airbnb"
      ]
    }
  }
}
```

To ignore robots.txt for all requests, use this version with `--ignore-robots-txt` args

```
1 {
2   "mcpServers": {
3     {
4       "mcpServers": {
5         "airbnb": {
6           "command": "npx",
7           "args": [
8             "-y",
9             "@openbnb/mcp-server-airbnb"
10          ]
11        }
12      }
13    }
14
15  }
16 }
```

<https://smithery.ai/>, here you can get MCP servers.
